It's a chilly day today. As I was creating my own worlds and Learn to Code 2 kind of wish I could put a fireplace in. That would be fun. But I did some experimenting, did some exploring, and you'll get to see some of the things that I was trying out and wanting to play with. So I put the stairs in and came up with one simple function to run through the switches, so that I could see if there were other ways to make this happen. This way took out three lines of code. It made for a much simpler code body that ran through the actual algorithm itself. I tried a different way. It made a simpler algorithm in the code body, but it didn't shorten the lines of code.
